

Unicode 5.0 Graphic Characters

This is a grid of all the graphic characters defined in the Unicode 5.0 standard. It includes characters from all major scripts and many other symbols used in various languages and fields. The grid is organized into rows and columns, where each row represents a different script or category of characters, and each column represents a specific character or symbol.

The characters are represented by small black squares. Some characters have multiple variants or forms, which are shown as separate squares in the grid. The grid is approximately 1000 columns wide and 1000 rows high, though the actual size may vary slightly due to the nature of the characters.

Some characters in the grid may not be correctly displayed or rendered by your system, especially if it does not support the full range of Unicode characters. In such cases, they will appear as small black squares or as question marks.

If you need to use these characters in your work, you can copy and paste them into your document or program. However, please note that some characters may not be correctly displayed or rendered by all systems or programs.
